1 INTRODUCTION Page 3

1 Introduction

1.1 What is Writer2LaTeX?

Writer2LaTeX is a utility to convert OpenDocument text and spreadsheet documents¹ – in particular documents containing formulas – into other formats.

Actually it is a collection of four converters:

- Writer2LaTeX converts OpenDocument text documents to LaTeX 2e, and works together with...
- Writer2BibTeX which extracts bibliographic data from an OpenDocument text document and converts it to BibTeX format.
- Writer2xhtml converts OpenDocument text documents to XHTML 1.0 strict, XHTML 1.1, XHTML 1.1 + MathML 2.0, HTML5, EPUB 2or EPUB 3 using CSS2 to convert style information.
- Calc2xhtml converts OpenDocument spreadsheet documents to XHTML 1.0 strict, XHTML 1.1 or HTML5, using CSS2 to convert style information.

Although Writer2LaTeX is a general OpenDocument converter, it is primarily designed for use with LibreOffice². You can use Writer2LaTeX

- ...as an extension for LibreOffice.
- ...as a command line utility, independent of LibreOffice.
- ...as a Java library providing conversions from OpenDocument for other Java programs.

Writer2LaTeX is a Java application, and thus should work on any platform that supports Java. You need a Java Runtime environment, **version 8** or later. Writer2LaTeX is developed and tested using OpenJDK (http://openjdk.java.net/)

This user's manual will explain how to install and use Writer2LaTeX.

Note: In this manual LO is used as an abbreviation of LibreOffice..

1.2 More about Writer2LaTeX and Writer2BibTeX

Writer2LaTeX is quite flexible: It can take advantage of several LaTeX packages, such as hyperref, pifont, ulem. It can create customized LaTeX code based on the styles and text in the document. Also it supports more than 25 different languages, latin, greek and cyrillic scripts and 8 input-encodings.

The flexibility makes it possible to use Writer2LaTeX from several philosophies:

• You can use LaTeX as a typesetting engine for your LO documents: Writer2LaTeX can be configured to create a LaTeX document with as much formatting as possible preserved. Note that the resulting LaTeX source will be readable, but not very clean.

Be aware that even though Writer2LaTeX tries hard to cope with any document, you will only get good results for well structured documents, ie. documents that are formatted using *styles*. For other documents you will find that Writer2LaTeX uses the principle *garbage in - garbage out!*

¹In addition, Writer2LaTeX supports the old file formats for OpenOffice.org 1.x Writer and Calc.

²It should also work with Apache OpenOffice

1 INTRODUCTION Page 4

• If you need to continue the work on your document in LaTeX your primary interest may be the content rather than the formatting. Writer2LaTeX can instructed to produce a LaTeX document which strips most of the formatting and hence produces a clean LaTeX source from any source document.

• Traditionally, LaTeX documents are written by hand using a text editor. Using a graphical frontend like LyX provides a more user friendly alternative. The Writer2LaTeX extension features a toolbar, which provides the basic functionality for using LO as a graphical frontend for LaTeX.

1.3 More about Writer2xhtml and Calc2xhtml

The primary goal for Writer2xhtml and Calc2xhtml is to provide *standards compliant* XHTML documents which can be customized to your specific needs.

- Standards compliance is necessary to ensure consistent results when the document is viewed in different browsers. It is also vital to ensure that the created document can be processed further by other tools.
- Customization means that you can control important aspects about the conversion. In particular you can control the style of the document:
 - You can let Writer2xhtml convert the style information in the source document and thus get an XHTML document that has the same general appearance as the original, but is adapted to an online environment.
 - You can create a document that adapts the style of the document to your own CSS style sheet.

2 Using the extensions

2.1 Installing of the extension

Writer2LaTeX can work as an extension for LibreOffice Writer.

Two LO extensions are provided:

- writer2latex.oxt installs support for LaTeX and BibTeX export in Writer
- writer2xhtml.oxt installs support for XHTML and EPUB export in Writer and Calc

The two extensions are independent, you can install one or both depending on your needs.

Note: Before you install the extensions, you need to set up LO to use Java. You can configure this in LO under **Tools** – **Options**. Of course this requires that you have installed a Java runtime environment on your system.

The extensions are installed and uninstalled using the Extension Manager in LO. If you need instructions about using the Extension Manager, see

https://help.libreoffice.org/Common/Extension_Manager

In case of installation troubles, please see the FAQ on Writer2LaTeXs web page:

http://writer2latex.sourceforge.net.

2.2 Using the extensions

The usage of the extensions is described in the help files: Help – LO Help – Writer2LaTeX/Writer2xhtml.

2.3 Exporting from the command line

You can also use the extensions to export to LaTeX, XHTML or EPUB from the command line. For example to export to HTML5, use the command line

```
soffice --headless --convert-to html:org.openoffice.da.writer2xhtml5 document.odt
```

Note that this does not work if LO is already running.

The paramter is the file extension followed by a colon, followed by a filter name. The possible filter names are detailed in the table below.

If you are using LO version 4.3.2 or later, you can also pass options to the filter. For example to export to LaTeX with pdfTeX as the backend using latin1 as the input encoding, use the command line

```
soffice --headless --convert-to tex:org.openoffice.da.writer2latex:backend=pdftex,inputencedocument.odt
```

The options must be supplied after an additional colon as a comma separated list. Each item should have the form name=value. See section 4 for information about the available options.

LaTeX	org.openoffice.da.writer2latex
BibTeX	org.openoffice.da.writer2bibtex
XHTML (text document)	org.openoffice.da.writer2xhtml
XHTML 1.1 (text document)	org.openoffice.da.writer2xhtml11
XHTML (spreadsheet)	org.openoffice.da.calc2xhtml
XHTML 1.1 (spreadsheet)	org.openoffice.da.calc2xhtml11
m XHTML + MathML	org.openoffice.da.writer2xhtml.mathml
HTML5 (text document)	org.openoffice.da.writer2xhtml5
HTML5 (spreadsheet)	org.openoffice.da.calc2xhtml5
EPUB	org.openoffice.da.writer2xhtml.epub
EPUB 3	org.openoffice.da.writer2xhtml.epub3

2.4 Custom configuration

Each of the exports provides the possibility to use a custom format/style. To edit this, choose **Tools** – **Options** – **Writer2LaTeX** resp. **Writer2xhtml.**

All three exporters uses a configuration file in the user installation folder for LO.

- On unix-like systems this folder will usually be something like home directory/.config/libreoffce/4/user
- On Windows it will usually be something like
 - C:\Documents and Settings\username\OpenOffice.org2\user

or

C:\Documents and Settings\username\
Application Data\LibreOffice\4\user

(Note that this directory may be hidden.)

Writer2LaTeX uses a file named writer2latex.xml, and Writer2xhtml and Calc2xhtml shares a file named writer2xhtml.xml. These files are created automatically the first time you use the custom configuration.

See section 4 for the structure of the configuration file.

2.5 Configuration packages

Advanced users may add further formats/styles to the lists in the export dialog. This is done using *configuration packages*, which are custom extensions to LO containing further configurations for Writer2LaTeX or Writer2xhtml.

A configuration package can contain:

- A configuration file for Writer2LaTeX or Writer2xhtml, see section 4.
- An XHTML template (Writer2xhtml only).

- An LO template.
- An LO registry file to glue the parts together.

The Writer2LaTeX distribution contains a sample configuration package **xhtml-config-sample.oxt** that demonstrates this.

As a demonstration of the principles of configuration packages, you can install this into LO using the Extension Manager:

- If you export to XHTML, the dialog will show an additional entry **Sample custom style** in the Style list.
- If you open **Templates and Documents** in LO you will find a new folder **xhtml-sample-config**. This folder contains a Writer template. If you create a document based on this template, **Sample custom style** will be preselected when you export to XHTML.

You can create your own configuration package based on this sample. Use a zip utility to unpack the extension. The following explains the individual parts of the sample configuration package.

The file description.xml

This files identifies the extension in LO. For your own configuration package you should choose a unique name for the identifier and a version number, eg.

```
<?xml version="1.0" encoding="UTF-8"?>
<description
  xmlns="http://openoffice.org/extensions/description/2006"
  xmlns:d="http://openoffice.org/extensions/description/2006">
  <identifier value="MyConfigPackage" />
  <version value="1.0" />
</description>
```

The files META-INF/manifest.xml and Paths.xcu

These files should be left unchanged.

The folder template

Put your LO Writer template in this folder (it is recommended to use a subfolder with a descriptive name). You may add more that one templates, and if you don't want to include a Writer template you may leave it empty (do not delete the folder).

The folder config

Put your Writer2LaTeX/Writer2xhtml configuration in this folder. If you are using Writer2xhtml, you should also put your XHTML template here.

The file Options.xcu

This is the central configuration file that glues together the content of the configuration package. See the following example for an explanation of the structure.

```
<?xml version='1.0' encoding='UTF-8'?>
<oor:component-data oor:name="Options"</pre>
```

For LaTeX, Writer2xhtml should be replaced by Writer2LaTeX here:

```
oor:package="org.openoffice.da.Writer2xhtml"
xml:lang="en-US"
xmlns:oor="http://openoffice.org/2001/registry"
xmlns:xs="http://www.w3.org/2001/XMLSchema">
```

XhtmlOptions may be replaced by XhtmlOptionsCalc or LaTeXOptions:

```
<node oor:name="XhtmlOptions">
     <node oor:name="Configurations">
```

The configuration needs a unique name (you may define several configurations in the same package):

```
<node oor:name="myconfig1" oor:op="replace">
```

You can define options which are normally set in the filter dialog. In that case you can lock (disable) the corresponding parts of the dialogs. To do so, add a comma separated list of options as value here. See below for the options that can be locked for each of the three filters.

The DisplayName is the name displayed in the style/format list in the filter dialog.

This path points to the configuration within the extension, you want to use:

This property (XHTML only) points to the XHTML template within the extension, you want to use:

This property (XHTML only) points to style sheet within the extension, you want to include (for EPUB export):

The next section defines the LO template you wish to connect with your configuration:

```
<node oor:name="Templates">
```

The entry needs a unique name:

About locked options

The options you can specify for the LockedOptions property depends on the filter. The following list details which options are available to lock for each filter (see section 4).

Writer2LaTeX

```
backend, inputencoding, multilingual, font, greek_math, additional_symbols<sup>3</sup>, use_bibtex, bibtex_style, wrap_lines_after, split_linked_sections, split_toplevel_sections, save_images_in_subdir, notes, metadata, display_hidden_text, original_image_size, simple_table_limit, float_tables, float_figures, float_options, ignore_hard_page_breaks, ignore_hard_line_breaks, ignore_empty_paragraphs, ignore_double_spaces
```

Writer2xhtml (XHTML export)

```
scaling, column_scaling, convert_to_px, image_size, notes, use_dublin_core, ignore_hard_line_breaks, ignore_empty_paragraphs, ignore_double_spaces, split_level, repeat_levels, save_images_in_subdir
```

Writer2xhtml (EPUB export)

```
scaling, column_scaling, relative_font_size, font_scaling, use_default_font, default_font_name, convert_to_px, image_size, ignore_hard_line_breaks, ignore_empty_paragraphs, ignore_double_spaces, display_hidden_text, notes, split_level, page_break_split, split_after, image_split, cover_image, external_toc_depth, include_toc, include_ncx
```

Calc2xhtml

³This is a pseudo-option which locks all the options use_pifont, use_ifsym, use_wasysym, use_eurosym and use_tipa.

scaling, column_scaling, convert_to_px, image_size, notes, use_dublin_core, display_hidden_sheets, display_hidden_rows_cols, display_filtered_rows_cols, apply_print_ranges, use_title_as_heading, use_sheetnames_as_headings, calc_split, save_images_in_subdir

3 Using the command line utility

3.1 How to install Writer2LaTeX for command line usage

Writer2LaTeX can work as a standalone command line utility (an installation of LO is not required).

Limitation: The export filters support conversion of embedded objects and graphics to a suitable format. The command line utility can only handle graphics in the original format.

Installation for Microsoft Windows

To install Writer2LaTeX under Microsoft Windows follow these instructions:

- 1. Unzip writer2latex6.zip into some directory. This will create a subdirectory writer2latex16.
- 2. Add this directory to your PATH environment variable (optional but recommended).

In some cases you may have to edit w21.bat slightly: The batch file assumes that the java executable is in your path. To verify this, open a command prompt and type java -version. If this test fails (or if you have several Java versions installed and want to use a specific version): Open the file w21.bat with a text editor and edit the approriate line to contain the full path to the Java executable, eg.

set JAVAEXE="C:\j2sdk1.7.0_67\bin\java"

Installation for Unix and friends

- 1. Unzip writer2latex16.zip into some directory. This will create a subdirectory writer2latex16.
- 2. Add this directory to your PATH environment variable (optional but recommended).
- 3. Add execute permissions to w21 as follows:

```
chmod +x w2l
```

In some cases you may have to edit the script slightly:

If you place w2l and writer2latex.jar in different directories, or if you choose to create a symbolic link to the script: Open the file w2l with a text editor and replace the path at the top of the file with the full path to Writer2LaTeX, eg.

```
W2LPATH="/home/username/writer2latex15"
```

Also, the script assumes that the java executable is in your path, or that the JAVA_HOME variable points to the locations. To verify the former, open a command shell and type java -version. To verify the latter, type env. If neither is the case or you have several Java versions installed you should edit this line to contain the full path to the Java executable, ie.

set MYJAVAEXE="/path/to/java/executable/"

3.2 Using the command line utility

To invoke the command line utility, use the command line

```
w21 <options> <source document/path> [<target document/path>]
```

The available options are

Group	Option	Explanation
	-latex	Convert to LaTeX (default)
	-bibtex	Convert to BibTeX
	-xhtml	Convert to XHTML 1.0 strict
Format	-xhtml11	Convert to XHTML 1.1
	-xhtml+mathml	Convert to XHTML + MathML
	-html5	Convert to HTML5
	-epub	Convert to EPUB
	-epub3	Convert to EPUB 3
	-config <file></file>	Load configuration file (see section 4)
	-ultraclean	Load the LaTeX format ultraclean
Config	-clean	Load the LaTeX format clean
Comis	-pdfprint	Load the LaTeX format pdfprint
	-pdfscreen	Load the LaTeX format pdfscreen
	-cleanxhtml	Load the XHTML format cleanxhtml
	-template <file></file>	Load an XHTML template
xhtml	-stylesheet <file></file>	Load a custom style sheet for inclusion in the document (EPUB export only)
	-recurse	Recurse into subdirectories (batch conversion)
Options	- <option> <value></value></option>	Set a configuration options (see section 4)

Some of the options are explained in more detail in the examples below.

Examples converting to LaTeX

The command line

```
w21 mydocument.odt mypath/myoutputdocument.tex
```

will convert the document mydocument.odt in the current directory, and save the result in the subdirectory mypath in the document myoutputdocument.tex.

The command line

```
w21 -config myconfig.xml mydocument.odt
```

will convert the document using the configuration file myconfig.xml (You can read more about configuration in section 4). As no output file is specified, Writer2LaTeX will use the same name as the original document, but change the extension to .tex.

You can also specify any simple option described in section 4 directly on the command line. Eg. to produce a file suitable for processing with pdfLaTeX:

```
w21 -backend pdftex mydocument.odt
```

Instead of giving your own configuration file, you can use one of the standard configurations. For example to produce a clean LaTeX file (ie. ignoring most of the formatting from the source document):

w21 -clean mydocument.odt

Examples converting to BibTeX from the command line

Writer2BibTeX extracts bibliography data to a BibTeX file. For example

w21 -bibtex mydocument.odt

will extract all bibliographic references from the document and store them in a file named mydocument.bib. You can also extract the data as part of the conversion to LaTeX, see section 4.

Examples converting to XHTML from the command line

The command line

w21 -xhtml+mathml mydocument.odt

will convert the document to XHTML+MathML, using the filename mydocument.xhtml.

Likewise the commandline

w2l -xhtml -config myconfig.xml mydocument.odt myresult.html

will convert into XHTML using the specified configuration and file name.

To produce a *clean* xhtml file (see section 4.3), for example:

w21 -cleanxhtml mydocument.odt mypath/myoutputdoc.html

Examples converting to EPUB from the command line

The command line

w21 -epub -split_level 2 mydocument.odt

will convert to EPUB, divding the document at sections of level 2

Likewise the command line

w2l -epub -stylesheet mystyles.css -cleanxhtml -split_level 2

will create an EPUB file using the custom style sheet mystyles.css for formatting.

4 Configuration

4.1 Writer2LaTeX configuration

LaTeX export can be configured with a configuration file. The location of the configuration depends on how you use Writer2LaTeX: Please see the sections on the export filter and the command line application.

The configuration is a file in xml format. Here is a sample configuration file for producing a document of class book, converting only basic formatting and optimizing for pdfTeX.

```
<?xml version="1.0" encoding="UTF-8" ?>
<config>
  <option name="backend" value="pdftex" />
  <option name="documentclass" value="book" />
  <option name="inputencoding" value="latin1" />
  <option name="use_pifont" value="false" />
  <option name="use_bibtex" value="false" />
  <option name="bibtex_style" value="plain" />
  <option name="formatting" value="convert_basic" />
  <option name="page_formatting" value="convert_all" />
  <heading-map max-level="4">
    <heading-level-map writer-level="1" name="chapter" level="0" />
    <heading-level-map writer-level="2" name="section" level="1" />
    <heading-level-map writer-level="3" name="subsection"</pre>
      level="2" />
    <heading-level-map writer-level="4" name="subsubsection"</pre>
      level="3" />
  </heading-map>
  <custom-preamble />
 <style-map name="Quotations" family="paragraph"</pre>
    before="\begin{quote}" after=\end{quote} />
  <string-replace input="LaTeX" latex-code="{\LaTeX}" />
</config>
```

Writer2LaTeX comes with five standard configuration files:

- ultraclean.xml to produce a clean LaTeX file, ie. almost all the formatting is ignored.
- clean.xml is a less radical version; preserves hyperlinks, color and some character formatting.
- pdfscreen.xml to produce a LaTeX file which is optimized for screen viewing using the package pdfscreen.sty.
- pdfprint.xml to produce a LaTeX file which is optimized for printing with pdfTeX.

In addition, you can find a sample configuration file suitable for documents originating from Google Docs in the directry samples/config.

The following subsections explains the available options. The options written in italics can be set using the dialog if you use Writer2LaTeX as an export filter.

General options

These options are used to control general aspects of the generated LaTeX document.

documentclass This options defines the name of the LaTeX documentclass to use article).		
global_options	This option is a list of global options to add to the document lass (the default value is an empty string).	
backend	This option can have any of the values generic, dvips, pdftex (default), xetex and unspecified. This will create LaTeX files suitable for any backend/dvi driver, dvips, pdfTeX or XeTeX respectively. The last value does not assume any specific backend. This value of the option affects export of graphics: Only file types than can be handled by the backend are included. If you use the filter, other graphics will be converted to a suitable format. If you use the command line application, other types will be commented out. If you use unspecified, no graphics will be commented out, nor converted.	
inputencoding	The option inputencoding can have any of the values ascii (default), latinatination tencoding latin2, iso-8859-7, cp1250, cp1251, koi8-r or utf8. This option has effect if the backend is XeTeX, in this case the encoding is always utf-8.	
multilingual	If this option is set to true (default), Writer2LaTeX will export all language information in the document. If backend is xetex, the package polyglossia.sty will be used, otherwise the package babel.sty. If the option is set to false, Writer2LaTeX will assume that the document is written in one language only. If backend is xetex, no language information will be exported, otherwise the language used for the majority of the text in the document will be exported using babel.sty.	
This option is used to select a font scheme. Supported to default, cmbright, ccfonts, ccfonts-euler, iwona, kurier kmath-kerkis, fouriernc, pxfonts, mathpazo, mathpple, txfonts, arev, charter-mathdesign, utopia-mathdesign, fourier.		
$greek_math$	This option can have the values true (default) or false. This means that greek letters in latin or cyrillic text are rendered in math mode. This behaviour assumes that greek letters are used as symbols in this context, and has the advantage that greek text fonts are not required. It is not used in greek text, where it would be look awful. This option has no effect if the backend is set to xetex.	

bles the use of Zapf Dingbats using the LaTeX
false. This option and the following five font
end is XeTeX.
bles the use of the ifsym symbol font using the
ault is false.
bles the use of the wasy symbol font using the
Default is false.
bles the use of the $bbding$ symbol font (a clone
TeX package bbding.sty. Default is false.
les the use of the eurosym font using the LaTeX
is false.
les the use of phonetic symbols using the LaTeX
ty. Default is false.
les true or false (default). This enables the
nath.sty (see section 6). This package defines
to convert formulas from LO to LaTeX. If this
sary definitions will be included in the LaTeX
ite long – so using ooomath.sty is recommended
s true or false (default). This enables use of
epresent the page count.

Options for bibliography (BibTeX)

These options controls the handling of the bibliography.

	Setting this option to true enables the use of BibTeX for bib-
use_bibtex	liography generation. If it is set to false (default), the bibli-
	ography is included as static text.
	This option can have any BibTeX style as value (default is
$bibtex_style$	plain). This is the BibTeX style to be used in the LaTeX
	document.
use_natbib	Setting this option to true loads the LaTeX package
## C_ 11# 0 0 0 0	natbib.sty.
natbib_options	Use this option to provide options to natbib.sty.
	Use this option to give a list of external BibTeX files. If the
	list is non-empty, bibliographic references in the document will
external_bibtex_files	be interpreted as keys in these files. If it is empty (default),
	the bibliographic references will be exported to a BibTeX file
	(provided use_bibtex is set to true).

	Use this option to define the encoding for the external BibTeX
	files. The default value is document, which means that the Bib-
bibtex_encoding	TeX files use the same encoding as the TeX document. Oth-
	erwise the same values as for inputencoding are supported.
	This setting has no effect if the backend is XeTeX.
	Use this option to give a list of external BibTeX files. If the list
	is non-empty and use_bibtex is set to true, Zotero references
	in the document will be interpreted as keys in these files. Also
zotero_bibtex_files	the Zotero bibliography, if any, will be exported as a LaTeX
Zotelo_blotex_liles	bibliography. This will take advantage of the LaTeX package
	natbib.sty. If use_natbib is set to true.
	Otherwise (default), Zotero references and bibliography will
	be exported as text.
	Use this option to give a list of external BibTeX files. If the list
	is non-empty and use_bibtex is set to true, JabRef references
	in the document will be interpreted as keys in these files. Also
 jabref_bibtex_files	the JabRef bibliography, if any, will be exported as a LaTeX
Jabrer_brotex_fires	bibliography. This will take advantage of the LaTeX package
	natbib.sty. If use_natbib is set to true.
	Otherwise (default), JabRef references and bibliography will
	be exported as text.
	If you convert Zotero or JabRef references, you can set this
 include_original_citations	option to true (default is false) to include the original cita-
11101440_011611141_0104010119	tion inserted by Zotero/JabRef as a comment in the LaTeX
	source.

File options

These options controls the creation of files associated with the main LaTeX document.

	The option specifies that Writer2LaTeX should try to break lines
	in the LaTeX source as soon as possible after this number of char-
$wrap_lines_after$	acters. Default is 72. If you use a text editor which supports
	wrapping of long lines, you may want to set this option to 0: In
	this case Writer2LaTeX will not wrap lines.
split_linked_sections	This option specifies that a linked section should be exported to
Spiii_tinkeu_sections	a separate LaTeX-file. Default is false.
split_toplevel_sections	This option specifies that all sections should be exported to a
spitt_toptedet_sections	separate LaTeX-file, excluding nested sections. Default is false.
	Images contained in the document are normally placed in the same
agua imagaa in gubdin	directory as the LaTeX document. If the document contains a
save_images_in_subdir	large number of images, it may be more convenient to put the
	images in a subdirectory. Set this option to true to do this.

Options for special content

	This option can have any of the values comment (default), ignore, marginpar,
	pdfannotation. This specifies what to do with notes (annotations) in the document:
	They can be ignored, converted to LaTeX comments, converted to \marginpar or con-
notes	verted to pdf annotations (which will default to \marginpar if the document is not
	processed with pdfLaTeX).
	In addition, you can give any LaTeX command (inluding the backslash), and the notes
	will be exported as \yourcommand{the note}.
If you set his option to true (default), Writer2LaTeX will export the titl	
	date of the document as found under File - Properties. Furthermore, if you have
metadata	chosen pdf as the backend, the title, author, subject and keywords will be exported to
	the pdf document and will be viewable if the pdf viewer supports it. If the option is
	false, only the title will be exported.

Figure and table options

The first options are used to control the handling og floating or non-floating figures and tables.

	Use this option to specify that you want to include graphics and text
	boxes in a floating figure environment. Default is false.
float figures	This option has no effect on graphics and text boxes that are anchored
$float_figures$	as character. These are always considered to be part of the normal
	text flow. If you want a figure to float, anchor it to paragraph or to
	character.
float_tables	Use this option to specify that you want to include tables in a floating
Jioai_taoies	table environment. Default is false.
float_options	Use this to give placement options to the figure and table floats, eg. h
J tout_op t tous	for here. Default is empty (default placement).
	Use this option to specify, that all graphics and text boxes should be
align_frames	centered. If you don't want that, set this option to false. Default is
	true.
	Use this option if you want to take advantage of the LaTeX package
use_caption	caption.sty. Currently Writer2LaTeX only uses the support for non-
	floating captions from this package.
	This option can be set to a sequence name in the source document.
	OpenDocument has a very weak sense of figure captions: A figure
figure_sequence_name	caption is a paragraph containing a sequence number. If you use LO's
	defaults, Writer2LaTeX can guess which sequence name to use. If it
	fails, you can give the name in this option (default is empty).

table_sequence_name	This is a similar option for tables.
---------------------	--------------------------------------

These options controls the export of tables:

	You can set this option to any non-negative integer (default is 0).
	Table cells in LO can contain any number of paragraphs, so nor-
	mally Writer2LaTeX exports tables with p columns. For simple
	tables where all cells only contains a single line it is better to use 1,
$simple_table_limit$	c and r columns. If all cells in a table contains at most one para-
	graph, and the <i>total</i> width of the table is less than this number
	of characters, the table will be exported with 1, c and r columns.
	This option has no effect on tables using tabulary.
use_longtable	This option is used to specify that longtable.sty should be used
_ 0	to export tables which may break across pages. Default is false.
	This option is used to specify that supertabular.sty should be
use_supertabular	used to export tables which may break across pages. Default is
	true. (You should only set one of the options use_longtable and
	use_supertabular to true).
use_tabulary	This option is used to specify that tabulary.sty should be used
ass_sasarary	to export tables. Default is false.
	This option is used, if you want to apply background color to tables
use_colortbl	using the package colortbl.sty. The value can be true or false
ase_colorabl	(default). This option has no effect unless you also set the option
	use_color to true.
	This option is used to produce advanced tables, that are not sup-
	ported in Writer. You can set this option to the name of a para-
table_first_head_style	graph style. If the first paragraph of the first cell in a row is for-
	matted with this paragraph style, the row in question will be used
	for the first head in a multipage table.
	Likewise this option specifies a paragraph style that identifies a
table_head_style	repeating head in a multipage table (like a normal table head in
	Writer).
	This option specifies a paragraph style that identifies a repeating
table_foot_style	foot in a multipage table.
+-\-\-\-\-\-\-\-\-\-\-\-\-\-\-\-\-\-\-\	This option specifies a paragraph style that identifies the last foot
table_last_foot_style	in a multipage table.
	1 0

These options controls the export of figures:

	Often images in a Writer document are scaled up or down from
	their original size. Normally the same scaling will be used in
original_image_size	the LaTeX document, but if you set this option ⁴ to true, the
	original (unscaled) image size will be used. The default value
	is false.

	This option can be used to specify, that the file ex-
remove_graphics_extension	tension on graphics files should be removed. You will
remove_graphics_extension	thus get eg. \includegraphics{myimage} rather than
	\includegraphics{myimage.png}.
	This option can be used to specify some options that should be
:	applied to all images (ie. all \includegraphics commands).
image_options	For example "width=\linewidth". Default is empty (no op-
	tions).

AutoCorrect options

	This option can have the values true or false (default). Setting
ignore_hard_page_breaks	the option to true will instruct Writer2LaTeX to ignore hard page
	breaks (but not soft page breaks specified in paragraph styles).
	This option can have the values true or false (default). Setting
ignore_hard_line_breaks	the option to true will instruct Writer2LaTeX to ignore hard line
	breaks (shift-Enter).
	This option can have the values true (default) or false. Setting
$ignore_empty_paragraphs$	the option to true will instruct Writer2LaTeX to ignore empty
	paragraphs; otherwise they are converted to a \bigskip.
	This option can have the values true (default) or false. Setting
ignore_double_spaces	the option to true will instruct Writer2LaTeX to ignore double
	spaces, otherwise they are converted to \ .

Formatting options

In Writer, formatting is controlled by styles. You can control how much formatting is exported using the following options. Note that these options has a major impact on the structure of the LaTeX document created.

⁴In previous versions, this option was called keep_image_size, but has been renamed to avoid confusion (the old name is still supported).

	The option formatting can have any of these values:
	• ignore_all will instruct Writer2LaTeX to ignore <i>all</i> character, paragraph, heading, list and footnote formatting contained in the document.
	• ignore_most will preserve basic character formatting.
formatting	• convert_basic (default) will preserve basic character formatting, paragraph justification and all numberings (lists, headings, footnotes).
	• convert_most will convert all supported formatting, except that paragraph formatting and font size is only converted if it is set by a style. To be able to preserve formatting, an environment is created for all paragraph styles, custom lists are used for listings, headings are reformatted using the \@startsection command etc.
	• convert_all will preserve <i>all</i> supported formatting.
page_formatting	This option can have any of the values ignore_all, convert_header_footer, convert_all This will ignore all page formatting, convert the header and footer (using custom page styles) or convert all supported formatting, including page geometry and footnote rule.
use_geometry	Setting this option to true specifies that the package geometry.sty should be used to export the geometry of the page (page size, margins etc.). Default is false, which will export the geometry using the low level LaTeX commands.
use_fancyhdr	Setting this option to true specifies that the package fancyhdr.sty should be used to export the header and footer of the page. Default is false, which will export the header and footer using the low level LaTeX page style commands.
use_color	This option can have the values true (default) or false. This enables use of the package color.sty to apply color in the LaTeX document.
use_ulem	This option can have the values true or false (default). This enables use of the package ulem.sty to support underlining and crossing out in the LaTeX document.
use_hyperref	This option can have the values true (default) or false. This enables use of the package hyperref.sty to include hyperlinks in the LaTeX document.
tabstop	This option is used to specify what to do with tabulator stops in the document. Normally these are converted to spaces, but with this option you can specify any LaTeX code, that should be used instead. For example "" or "\hspace{2em}"

	This option can have the values true or false (default). This enables use of
use_endnotes	the package endnotes.sty to format the endnotes in the LaTeX document.
	If set to false, endnotes will be converted to footnotes.

Options for including or excluding content

The following options can be used to control which content to export.

	If this option is set to true, (default is false), Writer2LaTeX will not create
	the a LaTeX preamble, nor include \begin{document} and \end{document}.
no_preamble	This is useful if the document is to be included in another LaTeX document.
	Note that in this case you will have to make sure that all packages/definitions
	needed are available in the master LaTeX document.
	If this option is set to true, (default is false), Writer2LaTeX will not export
no_index	indexes (e.g. table of contents, bibliopgrahy). This option is also intended for
no_index	the case that the document is to be part of a larger LaTeX document, which
	may contain global indexes.
	This option can all have the values accept (default), ignore, warning and
	error. This controls how to export paragraph and text content, for which
	there is no style map (see below).
other_styles	If the value of this option is accept, the content is handled as normal. If the
	value is ignore, the content is ignored silently. The values warning and error
	issues a message on the terminal resp. in the generated LaTeX code. This
	option thus lets you control that only content with accepted styles is exported.
image_content	This option has the same values, and is used to exclude image content.
table_content	This option also has the same values and is used to exclude table content.
display_hidden_te	If this option is set to true (default is false), paragraphs and text portions marked as hidden will be exported. Otherwise they will be ignored.

Compatibility options

	This option (default false) can be set to true if you are converting docu-
old_math_colors	ments created with LO 4.3 or earlier. This enables the use of the old color
	scheme for formulas (using dark variants of red, blue, cyan and magenta).

Headings

The heading_map section specifies how headings in LO should map to LaTeX. Eg. the first line in the sample above specifies that the toplevel heading (Heading 1) should map to \chapter, which is of level 0 in LaTeX. Up to 10 levels are supported (the same number as in LO).

Style maps

In addition you can specify maps from styles in Writer to your own LaTeX styles in the configuration. Currently this is possible for text styles, paragraph styles and list styles. In addition a few direct formatting attributes can be mapped to LaTeX code. The following examples are from the standard configuration file article.xml.

This is a simple rule, that maps text formatted with the text style **Emphasis** to the LaTeX code \emph{...}:

```
<style-map name="Emphasis" family="text" before="\emph{" after="}" />
```

This is another simple rule, that maps paragraphs formatted with the paragraph style **part** to the LaTeX code \part{...}. The attribute line-break ensures that no line breaks are inserted between the code and the text.

```
<style-map name="part" family="paragraph" before="\part{" after="}"
line-break="false" />
```

This is a rule, that maps paragraphs formatted with style **Preformatted Text** to the LaTeX environment verbatim. The attribute verbatim ensures that the content of the paragraph is exported verbatim (this implies that characters not available in the inputenc are converted to question marks and that other content is discarded, eg. footnotes). The paragraph-block entry specifies code to go before and after an entire block of paragraphs. The name attribute specifies the style of the first paragraph; the next attribute specifies the style(s) of subsequent paragraphs in the block.

```
<style-map name="Preformatted Text" family="paragraph-block"
next="Preformatted Text" before="\begin{verbatim}" after="\end{verbatim}" />
<style-map name="Preformatted Text" family="paragraph" before="" after=""
verbatim="true" />
```

This is a more elaborate set of rules, that maps paragraphs formatted with styles **Title**, **author** and **date** (in any order) to \maketitle in LaTeX.

```
<style-map name="Title" family="paragraph" before="\title{" after="}"
line-break="false" />
<style-map name="author" family="paragraph" before="\author{" after="}"
line-break="false" />
<style-map name="date" family="paragraph" before="\date{" after="}"
line-break="false" />
<style-map name="Title" family="paragraph-block" next="author;date" before=""
after="\maketitle" />
<style-map name="author" family="paragraph-block" next="Title;date" before=""
after="\maketitle" />
<style-map name="date" family="paragraph-block" next="Title;author" before=""
after="\maketitle" />
<style-map name="date" family="paragraph-block" next="Title;author" before=""
after="\maketitle" />
```

This will produce code like this:

```
\title{Configuration}
\author{Henrik Just}
\date{2006}
\maketitle
```

The next example maps a paragraph formatted with the **theorem** list style to a LaTeX environment named **theorem**. Note that there are two entries for a list style: The first one to specify the LaTeX code to put before and after the entire list. The second one to specify the LaTeX code to put before and after each list item.

```
<style-map name="theorem" family="paragraph" before="" after="" />
<style-map name="theorem" family="list" before="" after="" />
<style-map name="theorem" family="listitem" before="\begin{theorem}"
after="\end{theorem}" />
```

When you override a style, all formatting specified in the original document will be igored.

Finally an example using direct formatting attributes:

```
<style-map name="italic" family="text-attribute" before="\emph{" after="}" />
```

Currently the only supported names are italic, bold, small-caps, superscript and subscript.

String replace

Often LaTeX requires special care to typeset certain constructions. For example according to German typographical rules, an abbreviation like z.B. should be typeset with a small space before the B. You can specify this in the configuration:

```
<string-replace input="z.B." latex-code="z.\,B." />
```

The input is the text in the LO document, the latex-code is the LaTeX code to export for this text.

Another example is French quotations marks (« Je parle français ») which should be converted to the LaTeX macros \fg and \og. This can be achieved using this rule:

```
<string-replace input="&#xAB;&#xAO;" latex-code="\fg " />
<string-replace input="&#xAO;&#xBB;" latex-code="\og " />
```

The final example ensures that the LaTeX logo is typeset correctly

```
<string-replace input="LaTeX" latex-code="{\LaTeX}" />
```

Math symbols

In LO Math you can add user-defined symbols. Writer2LaTeX already understands the predefined symbols such as %alpha. If you define your own symbols, you can add an entry in the configuration that specifies LaTeX code to use. The math-symbol-map element is used for this:

```
<math-symbol-map name="'ddarrow" latex="\Downarrow" />
```

This example will map the symbol %ddarrow to the LaTeX code \Downarrow.

Custom preamble

The text you specify in the element custom-preamble will be copied verbatim into the LaTeX preamble. For example:

```
<custom-preamble>\usepackage{palatino}</custom-preamble>
```

to typeset your document using the postscript font palatino.

4.2 Writer2xhtml and Calc2xhtml configuration

Also the XHTML export can be configured with a configuration file in xml format. This is a sample configuration file:

```
<?xml version="1.0" encoding="UTF-8"?>
<config>
    <option name="custom_stylesheet" value="/mystyle.css" />
    <option name="ignore_styles" value="false" />
    <option name="use_dublin_core" value="true" />
    <option name="convert_to_px" value="true" />
    <option name="split_level" value="1" />
```

```
<xhtml-style-map name="mystyle" family="paragraph" element="p"
css="mycssclass" />
</config>
```

The following subsections explains the available options. The options written in italics can be set using the dialog if you use Writer2xhtml as an export filter.

Style options

You can control some general aspects of the generated XHTML documents using these technical options.

	This option is used to specify the id's used for XHTML templates.
	These should be provided as a comma separated list defining the id
	for content, header, footer and panel in that order. The list can be
template_ids	truncated if you don't need them all.
	The default is empty, which is equivalent to
	content, header, footer, panel.
	Set this option to false (default is true) if you don't want "pretty
pretty_print	print" (using indentations and line breaks) in the XHTML output.
	If you set this options to true (default is false), Writer2xhtml will
	not include the !DOCTYPE declaration in the converted document. The
no_doctype	!DOCTYPE is required for a valid XHTML document: This option should
	only be used if you need to process the document further.
	This option is used to specify the character encoding to use for the
on and in m	XHTML document. Currently supported encodings are UTF-8 (de-
encoding	fault), UTF-16, ISO-8859-1 and US-ASCII. Characters not supported
	by the encoding are exported as numeric character entities.
	When this option is set to true (default) numeric character entities are
hexadecimal_entities	exported using hexadecimal numbers, otherwise decimal numbers are
	used
	If you set this options to true (default is false), Writer2xhtml will
use_named_entities	use named character entities as defined by (X)HTML. If you export to
	XHTML+MathML, also named MathML entities will be used.
	In rare cases, it may be required to ad a BOM (Byte Order Mark) to
add_bom	the XHTML document. Most applications will not need this, but you
	can set this options to true to enable this (default is false).
multilingual	Set this to false (default is true) to remove language information
mulollingual	from the file (except on the root element)
	Set this to true (default is false) to generate a separate CSS file if the
separate_stylesheet	XHTML document is split over several files (thus avoiding repeating
	the style information in every file).

	Use this option to give an URL to your own, external CSS stylesheet. If
	the value is empty or the option is not specified, no external stylesheet
custom_stylesheet	will be used.
	For more advanced solutions (eg. different style sheets for screen view-
	ing and printing) you can use an XHTML template – see below.

The following options are used to control the conversion of the formatting in the source document. If you use an external CSS style sheet, this is important to define.

	The option formatting is used to specify how much text for-
	matting (character, paragraph and list formatting) to export ⁵ .
	Possible values are
	convert_all (default): Convert all formatting to CSS.
	ignore_styles: Convert hard formatting but not formatting by
	styles. Use this value if you use a custom stylesheet, but still
	want to be able to add some hard formatting (eg. a centered
formatting	paragraph, some bold text etc.)
	ignore_hard: Convert formatting by styles, but no hard format-
	ting (except as given by attribute style maps, see below). Use
	this if the document is well structured using styles, so that any
	hard formatting should be considered an error.
	ignore_all: Convert no formatting at all. Use this value if you
	use a custom stylesheet and the document is well structured using
	styles, so that any hard formatting should be considered an error.
frame_formatting	Used for the same purpose for frame formatting.
section_formatting	Used for the same purpose for section formatting. (But note that
 pection Tormatting	LO does not offer section styles currently).
table_formatting	Used for the same purpose for table formatting. (But note that
table_roimatting	LO does not offer table styles currently).
	This option defines how to export table dimension. The possible
	values are:
	none: Do not export table dimensions (table width, column width
 table_size ⁶	and row height), leaving the layout of the tables to the browser.
04516_5126	auto (default): Convert the dimensions in the source document
	using relative or absolute values as defined.
	relative: Convert the dimensions in the source document, but
	always using relative values for table width and column width.

basic support for list labels, and currently the browsers default indentations are used. css1_hack: This value is used to fix a problem with continued lists. Writer2xhtml will export a list that continues on level 2 or below like This is not valid in XHTML, but works in browsers. Also two deprecated attributes are used to continue numbering. 		This option determines how list formatting is exported. Possible

use_default_font for the entire	use_default_font	formation in the document and use a default font for the entire
exported document.		
		Use this option to supply a font name to use if the option
	default_font_name	use_default_font is set to true. A blank value will not insert
ant font information.		ant font information.

In addition, a number of options defines how dimensions in the source document should be handled.

⁵This and the following options replaces the former option ignore_styles.

⁶This option replaces the former option ignore_table_dimensions. (The former values correspond to the values none and auto).

⁷In previous versions, this option was called list_hack, but was renamed to support the new value hard_labels. (The old name is still supported.)

	When this option is true (default), Writer2xhtml will convert all units
convert_to_px	to px, otherwise the original units are used. The resolution is assumed
	to be 96ppi, you can change this with the scaling option. Eg. a scaling
	of 75% will change the resolution to 72ppi. For EPUB export this option
	will export font sizes as percentages (and use px for other dimensions).
	Use this option to specify a scaling of all formatting, ie. to get a different
scaling	text size than the original document. The value must be a percentage,
	default is 100%.
column_scaling	Use this option to specify an additional scaling for table colums. The
	value must be a percentage, default is 100%.
	Use this option to specify how to export the size of images and text
	boxes: Possible values are absolute or auto (default, export absolute
image_size8	size), relative (export the size as a percentage of the current text width)
	and none or original_image_size (do not export size information; hence
	the browser or reader will use the original (unscaled) image size).
	Set this option to true (default) false to export all font sizes as percent-
relative_font_size	ages rather than using absolute dimensions. The font size is calculated
	relative to the default font size in the document.
font_scaling	Use this option to specify a scaling for all font sizes if
	relative_font_size is set to true. Default is 100%.

Options for special content

	If you are not exporting to XHTML+MathML or HTML5, this option
formulas	defines how formulas are treated. The possible values are starmath
	(default) to export the formula in StarMath notation, latex to export
	the formula in LaTeX notation, image+starmath and image+latex
	to export the formula as an image, with an alt attribute giving the
	formula in StarMath or LaTeX notation.
	If you export to XHTML+MathML or HTML5, you can set this op-
use_mathjax	tion to true (default is false) to load the MathJax library on pages
use_mathjax	with fomulas. This will ensure that formulas are viewable on all mod-
	ern browsers, even if they do not support MathML natively ⁹ .
	If you export to HTML5, you can set this option to true to export
embed_svg	vector graphics embedded in the HTML documents as SVG (scalable
embed_svg	vector graphics). If set to false (default), external SVG image files
	will be used.
	If you set this option to true (default is false), all images will be
embed_img	embedded directly in the HTML document (base64 encoded). This is
	not recommended for documents with large images.
endnotes_heading	In LO the endnotes are set on a separate page at the end of the
	document. It is not possible to give this page a heading, but you can
endnotes_neading	use this option to add a heading. In EPUB export this heading will
	also appear in the navigation table. Default is empty (no heading).

⁸This option replaces old options keep_image_size and original_image_size (the old names are still supported).

document (if configured to do so). It is not possible to give this a heading, but you can use this option to add a heading. In Element (is empty (no heading)). Use this option to specify if Dublin Core Meta data should be	age
export this heading will also appear in the navigation table. Desire this empty (no heading). Use this option to specify if Dublin Core Meta data should be	
is empty (no heading). Use this option to specify if Dublin Core Meta data should be	PUB
Use this option to specify if Dublin Core Meta data should be	ault
	ex-
ported.	
For the XHTML export, the format will be as specified in h	tp:
use_dublin_core	
For the EPUB export this option has no effect.	
If the value is false, it will not be exported (default is true).	
If this option is set to true (default), notes in the document wi	l be
notes exported as XHTML comments. These are not directly visible in	the
browser. If you don't want to include notes, set this option to fa	se.
If this option is set to true (default is false), paragraphs and	text
display_hidden_text portions marked as hidden will be exported. Otherwise they wi	l be
ignored.	
If this option is set to true (default), the table of contents is expo	ted.
include_toc	pos-
sibility is mainly intended for EPUB, which also provides an exte	$_{ m rnal}$
navigation table.	
This option is specific for EPUB export. If the target format is El	PUB
include_ncx 3 and this option is set to true (default is false), a navigation	doc-
ument in the old NCX format is included together with the EPU	В 3
Navigation Document.	

AutoCorrect options

	This options can have the values true (default) or false. Setting
ignore_double_spaces	the option to true will instruct Writer2xhtml to ignore double
	spaces, otherwise they are converted to non-breaking spaces.
	This option can have the values true (default) or false. Setting
$ignore_empty_paragraphs$	the option to true will instruct Writer2xhtml to ignore empty
	paragraphs
	This option can have the values true or false (default). Setting
$ignore_hard_line_breaks$	the option to true will instruct Writer2xhtml to ignore hard line
	breaks (Shift-Enter in LO).

⁹This replaces the output format (available until Writer2LaTeX 1.2) using an XSLT style sheet for the same purpose.

File options

 $external_toc_depth$

In addition to the text content, an EPUB document contains a table of contents, which can be used for navigation in the reader. This table is generated by Writer2xhtml from the headings in your document. This option is used to specify the number of levels to include in the table. The default value is auto, which determines the depth from the option split_value. If you want to set the depth independent from split_value, set this option to a positive integer.

	This option is used to specify that the Writer documents should be
$split_level$	split in several documents and the outline level at which the splitting
	should happen (the default 0 means no split). This is convenient for
	long documents. Each output document will get a simple navigation
	panel in the header and the footer (with labels in the same language
	as the document).
	If you split the document, you can use this option to specify that
repeat_levels	headings of higher levels should be repeated on page breaks. This
repeat_tebets	may help the user to identify the current position in the document.
	Default is 5 (all levels are repeated).
	An alternative method to split the document is to use the original
	page breaks. Possible values are
	none (default): Do not split at page breaks.
	styles: Split at page breaks which are defined in styles.
	explicit: Split at all explicit page breaks (page breaks defined in
page_break_split	styles and manual page breaks)
	all: Split at all page breaks. Automatic page breaks may occur
	within a paragraph, list or table, but Writer2xhtml will not split
	until this structure has ended.
	Also in this case, each output document will get a simple navigation
	panel in the header and the footer.
	This option (which only has effect for EPUB export) is used to
	automatic split long documents. When a single file exceeds the
split_after	number of characters defined by this option (in 1000s), the document
	will be split at the first possible break point. The value 0 disables
	automatic split.
	This option (which only has effect for EPUB export) is used to
	convert large images to "full screen" images. The value of the option
image_split	can be either none or a percentage. If set to a percentage, an image
	which is wider than this percentage and has an aspect ratio of at
	least 3:4 is placed in a separate file.
	If you set this option to true (default is false), the first image in
cover_image	the document is used as cover image in EPUB export.
	Images contained in the document are normally placed in the same
	directory as the XHTML document. If the document contains a
save_images_in_subdir	large number of images, it may be more convenient to put the images
	in a subdirectory. Set this option to true to do this.

uplink	This option is used to specify a link which brings the user up in a
upiink	page hierarchy. For example "/index.html".

Options specific for spreadsheet documents

	Set this option to true if you want spreadsheet documents
	should be split in several documents (one for each sheet).
	This is convenient for large spreadsheets. Each output doc-
calc_split	ument will get a simple navigation panel in the header and
	the footer.
	The default value is false, which means that the entire
	spreadsheet will be converted to a singe XHTML document.
diamlass hiddam about a	Set this option to true if you want to export sheets that
$ig display_hidden_sheets$	are defined as hidden. Default is false.
display_hidden_rows_cols	Set this option to true if you want to export rows or
utsprug_nruuen_rows_cors	columns that are defined as hidden. Default is false.
display_filtered_rows_cols	Set this option to true if you want to export rows or
wvopvwg_j vvver ew_rvwo_evvo	columns that are not visible due to a filter. Default is false.
	I you set this option to true, the print ranges defined in the
	document will be used. The content of the result will thus
apply_print_ranges	be identical to the content of printed output. If you set the
app vg_pr vivo_r wivges	option to false (default), the content of the output will be
	identical to the content that you can see when editing the
	document.
	If you set this option to true (default), the title of the
$ use_title_as_heading $	document will be included in the XHTML document as a
	heading.
	If you set this option to true (default), the sheet name will
use_sheet_names_as_headings	be added as a heading above each table in the XHTML
	document.

Options for batch conversion

directory_icon	Used to specify an URL for an (icon) image that represents a directory. This
directory_icon	is used when Writer2xhtml creates index pages for a directory.
document_icon	Used to specify an URL for an (icon) image that represents a document. This
document_1con	is used when Writer2xhtml creates index pages for a directory.

Style maps

In addition to the options, you can specify that certain styles in Writer should be mapped to specific XHTML elements and CSS style classes. Here are some examples showing how to use some of the built-in Writer styles to create XHTML elements:

```
<xhtml-style-map name="Sender" family="paragraph"</pre>
           element="address" css="(none)" />
  <xhtml-style-map name="Quotations" family="paragraph"</pre>
           block-element="blockquote" block-css="(none)"
           element="p" css="(none)" />
  <!-- map LO text styles to xhtml elements -->
  <xhtml-style-map name="Citation" family="text"</pre>
           element="cite" css="(none)" />
  <xhtml-style-map name="Emphasis" family="text"</pre>
           element="em" css="(none)" />
  <!-- map hard formatting attributes to xhtml elements -->
  <xhtml-style-map name="bold" family="attribute"</pre>
           element="b" css="(none)" />
  <xhtml-style-map name="italics" family="attribute"</pre>
           element="i" css="(none)" />
</config>
```

An extended version of this is distributed with Writer2LaTeX, please see the file cleanxhtml.xml.

The attributes of the xhtml-style-map element are used as follows:

- name specifies the name of the Writer style.
- family 10 specifies the style family in Writer; this can either be text, paragraph, heading, frame, list or attribute. The last value does not specify a real style, but refers to hard formatting attributes. The possible names in this case are bold, italics, fixed (for fixed pitch fonts), superscript, subscript, underline and overstrike.
- element specifies the XHTML element to use when converting this style. This is not used for frame and list styles.
- css specifies the CSS style class to use when converting this style. If it is not specified or the value is "(none)", no CSS class will be used.
- block-element only has effect for paragraph and heading styles. For paragraphs it is used to specify a block XHTML element, that should surround several exported paragraphs with this style. For headings it is used to specify the element containing the entire heading (the element is used for the text content only, excluding the label).
- block-css specifies the CSS style class to be used for this block element. If it is not specified or the value is "(none)", no CSS class will be used.
- before and after only has effect for paragraph and heading styles. This attribute defines a fixed text to add before/after the text of all paragraphs formatted with this style. This is similar to the pseudo-elements::before and::after in CSS.

For example the rules above produces code like this:

```
This paragraph is Text body
<address>This paragraph is Sender</address>
```

¹⁰Previously this attribute was called class.

```
<blockquote>
  This paragraph is Quotations
  This paragraph is also Quotations
</blockquote>
This paragraph is also Text body and has some <em>text with emphasis style</em> and uses some <b>hard formatting</b>.
```

You can use your own Writer styles together with your own CSS style sheet to create further style mappings, for example:

Note that the rules for hard formatting are only used when formatting is set to ignore_hard or ignore_all. It is not recommended to rely on these rules, using real text styles is preferable. They are included because the use of hard character formatting is very common even in otherwise well-structured documents.

XHTML templates

You can use your own XHTML document as a template for the generated XHTML documents. This should be an ordinary XHTML file (do not include DOCTYPE declaration) with some special elements:

- An element with the id content is used to fill the text content. If no such element exists, the
 <body> element is used. If there is no <body> element in the template, the root element is used.
- Elements with the id header or footer (optional) will be filled with a simple navigation panel using a first/previous/next/last scheme (for spreadsheet documents, sheet names are used for navigation).
- An element with the id panel (optional) will be filled with a simple navigation panel using a table of contens-like scheme.

You can change the names of the id attributes using the template_ids option.

A simple template including a header might look like this:

```
</html>
```

As the template does not include footer and panel nodes, these elements will not be included.

A template with all the elements, suitable for HTML5 might look like this:

The absolute mininal template is this:

```
<div/>
```

The div-element will be used as the content container. The generated document will not be a complete XHTML document (no <html>, <head> and <body> nodes). It will however still be a well-formed XML file that can be handled with standard tools. The use case for this is that you can produce XHTML fragments suitable for inclusion in e.g. a CMS.

Note: Make sure to set the option no_doctype to true in this case!

4.3 Using LibreOffice to create XHTML documents

The configuration file cleanxhtml.xml that is distributed with Writer2LaTeX, can be used to create semantically rich XHTML content, which can be formatted with your own stylesheet (you should edit the file to add the URL to the stylesheet you want to use).

A subset of the built-in styles in Writer are mapped to XHTML elements (note that the style names are localized, so this is for the english version of LibreOffice):

LO Writer style	LO Writer style family	XHTML element
Text body	paragraph style	p
Sender	paragraph style	address
Quotations	paragraph style	blockquote
Preformatted Text	paragraph style	pre
List Heading	paragraph style	dt (in dl)
List Contents	paragraph style	dd (in dl)
Horizontal Rule	paragraph style	hr
Citation	text style	cite

LO Writer style	LO Writer style family	XHTML element
Definition	text style	dfn
Emphasis	text style	em
Example	text style	samp
Source Text	text style	code
Strong Emphasis	text style	strong
Teletype	text style	tt
User entry	text style	kbd
Variable	text style	var
bold	hard formatting attribute	b
italics	hard formatting attribute	i
fixed pitch font	hard formatting attribute	tt
superscript	hard formatting attribute	sup
subscript	hard formatting attribute	sub

So by using these styles only, you will create well-structured XHTML documents. See the document sample-xhtml.sxw for an example of how to use this.

Links

LO does not support all kind of XHTML link attributes, for example you cannot set title or rel. Writer2xhtml provides a solution for thus using the name attribute: You can define values for all attributes by providing a semicolon separated list of names and values, eg.

```
title=My title;rel=next
```

will create an XHTML link like

```
<a href="..." title="My title" rel="next">
```

If the name attributes does not contain such a list, the value is used for the name and title attribute:

```
My name
```

will create an XHTML link like

```
<a href="..." name="My name" title="My name">
```

5 Special features for the EPUB export

5.1 Meta data

Writer2xhtml always exports the title of the document, and also the subject, keywords and description if they are non-empty.

The EPUB standard specifies a number of meta data elements not supported by ODF. Writer2xhtml supports these elements using user-defined meta data. To add user-defined meta data choose **File-Properties**, **User-defined properties**. (The export filter includes a custom editor for these.) The following properties are supported:

• Identifier: Each EPUB document must have a unique ID. Normally Writer2xhtml generates a Universal Unique ID (UUID) for this purpose, but you may override this with your own ID.

To do this add a new property, enter **Identifier** (case is not important) as name and the ID as value.

An identifier may follow a specific identification scheme, e.g. ISBN. To specify an identification scheme, append this to the name separated by a period, e.g. **Identifier.ISBN**.

It is possible to have several identifiers, in this case append a number to the name, e.g. **Identifier1.ISBN** and **Identifier2**. The first identifier is used as the unique ID.

• Creator: A primary creator or author of the publication.

Enter **Creator** as name and the creator's name as value.

A creator may have a special role, you can specify this with a three letter code after the word **creator**, e.g. **creator.aut** for the author or **creator.ill** for the illustrator. For the complete list of three letter codes see the EPUB specification (http://www.idpf.org/2007/opf/OPF_2.0_final_spec.html).

You can define several creators, in this case add a number to the word **creator**, e.g. **creator1.aut** and **creator2**. The creators will be sorted according to the numbers. Note that some readers may only present the first creator.

If no creator is defined, Writer2xhtml will export the default creator given in the document (this is usually taken from LO's user settings).

- Contributor: A party whose contribution to the publication is secondary to those named in creator elements. Otherwise it is handled like Creator, and the same rules apply.
- Date: Date of publication. The date must be in the format YYYY-MM-DD (year-month-date) or more generally in the format specified in http://www.w3.org/TR/NOTE-datetime.

A date may be associated with a special event such as **creation**, **publication** or **modification**. To define this, add the event after the word **date**, e.g. **date.publication**.

You can give several dates, in this case add a number to the word date, e.g. date1.creation, date2.modification.

If you don't define any dates, Writer2xhtml will include the date the document was last modified

You can only have one instance of the remaining properties, hence they cannot be numbered. Also no additional data can be appended to the name.

- **Publisher**: The publisher of the document.
- Type: Terms describing general categories, functions, genres, or aggregation levels for content.
- Format: The media type or dimensions of the resource.
- Source: Information regarding a prior resource from which the publication was derived.
- Relation: An identifier of an auxiliary resource and its relationship to the publication.
- Coverage: The extent or scope of the publication's content.
- Rights: A statement about rights, or a reference to one.

5.2 Hidden hedings

If the entire text of a heading is striked out (using any strike-out style), this heading will be hidden in the text. It will however still be visible in the EPUB table of contents.

6 The LaTeX package ocomath.sty

LO/AOO Math has a few features that are not available in standard LaTeX packages. To support those features, Writer2LaTeX will insert definitions in the LaTeX preamble. As an alternative, Writer2LaTeX provides an optional package ooomath.sty¹¹ which implements these constructions. This packages is only needed for documents containing formulas. Setting the option use_ooomath to true enables the use of this package (see section 4.1)

It is sufficient to put ocomath.sty in the same directory as the converted LaTeX document. It will however be more convenient if you install it in your TeX distribution. The proper place will usually be the "local texmf tree", please see the documentation of your TeX distribution. Below are specific instructions for TeX Live on Linux and MikTeX on Windows:

Instructions for TeX Live (Linux)

If you use teTeX or TeX Live on Linux you can install ocomath.sty as follows:

Open a shell and type

texconfig conf

This will list the configuration details for TeX. Under the heading "Kpathsea" you will see a list of directories searched by TeX. You can put ocomath.sty in the subdirectory tex of any of these directories. Usually the directory

/home/<user name>/texmf/tex

can be used for the local texmf tree (you can create it if it doesn't exist).

Next you should type

texconfig rehash

to make TeX refresh it's filename database.

Instructions for MikTeX (Windows)

If you use MikTeX you can install ocomath.sty as follows:

First you should create a local texmf tree if it does note already exist. Start MikTeX settings (All Programs - MikTeX - Maintenance - Settings). Choose the admin variants if you want to install for all users. If the list on the tab page Roots is empty, create a suitable directory such as C:\localtexmf, click Add and select this directory.

Copy ocomath.sty to the tex subdirectory in the local texmf tree. If the subdirectory tex does not exist, you can create it.

Next you should start "MikTeX Options". On the tab page **General**, click the button **Refresh Now** to make MikTeX refresh it's filename database.

¹¹This pakcage replaces writer.sty used by older versions of Writer2LaTeX.

7 Using Writer2LaTeX from another application

7.1 Using Writer2LaTeX from a Java application

Writer2LaTeX features a simple API to convert documents from another Java application. Please see the javadoc for writer2latex.jar (the package writer2latex.api) for details.

The API offers a stream based as well as a file based interface for conversions.

Here's a simple example showing how to convert a file to LaTeX using a custom configuration (excluding exception handling) using the file based methods of the API.

```
import java.io.File;
     import writer2latex.api.*;
     // Create a LaTeX converter
     Converter converter =
         ConverterFactory.createConverter("application/x-latex");
     // Configure the converter
     Config config = converter.getConfig();
     config.read(new File("myconfig.xml"));
     config.setOption("inputencoding","latin1");
     // Convert the document
     ConverterResult result =
         converter.convert(new File("mydocument.odt"),
             "mydocument.tex");
     // Write the files
     result.write(new File("mydirectory"));
Using the stream based methods the conversion may look like this (assuming the option
save_images_in_subdir is set to false):
     import java.io.FileInputStream;
     import java.io.FileOutputStream;
     // Convert the document
     ConverterResult result =
         converter.convert(new FileInputStream("mydocument.odt"),
         "mydocument.tex");
     // Write the files
     Iterator<OutputFile> docs = result.iterator();
     while (docs.hasNext()) {
         OutputFile docOut = (OutputFile) docs.next();
         FileOutputStream fos =
             new FileOutputStream("mydirectory/"+docOut.getFileName());
         docOut.write(fos);
```

```
fos.flush();
fos.close();
}
```

Writer2LaTeX also offers an interface for batch conversion of a directory into XHTML. For at simple example, see the source of Application.java.

7.2 Using Writer2LaTeX from a Basic macro

You can also access Writer2LaTeX through LO's api. Here's an example using a Basic macro, but the principle is the same for any other language with a UNO binding.

Writer2LaTeX is used as any other filter in LO. Using the parameter FilterData, you can provide specific options for Writer2LaTeX: You can give an URL for a configuration file to use and/or you can provide values for simple options (the order does not matter, the configuration file is always read first). In addition (XHTML export only), you can define a target template and an included style sheet.

This example exports a document to LaTeX using a specific configuration, but overriding the value of the option use_colortbl.

```
Dim sUrl As String
sUrl = <url to document>
Dim sConfigUrl As String
sConfigUrl = <url to config>
Dim oFilterData(1) As New com.sun.star.beans.PropertyValue
oFilterData(0).Name = "ConfigURL"
oFilterData(0).Value = sConfigUrl
oFilterData(1).Name = "use_colortbl"
oFilterData(1).Value = "true"
Dim oProps(2) As New com.sun.star.beans.PropertyValue
oProps(0).Name = "FilterName"
oProps(0).Value = "org.openoffice.da.writer2latex"
oProps(1).Name = "Overwrite"
oProps(1).Value = true
oProps(2).Name = "FilterData"
oProps(2).Value = oFilterData
```

ThisComponent.StoreToURL(sUrl, oProps())

The table lists the names of the filters provided by Writer2LaTeX:

Format	Filter Name
LaTeX	org.openoffice.da.writer2latex
BibTeX	org.openoffice.da.writer2bibtex

XHTML (text document)	org.openoffice.da.writer2xhtml
XHTML 1.1 (text document)	org.openoffice.da.writer2xhtml11
XHTML (spreadsheet)	org.openoffice.da.calc2xhtml
XHTML 1.1 (spreadsheet)	org.openoffice.da.calc2xhtml11
m XHTML + MathML	org.openoffice.da.writer2xhtml.mathml
HTML5 (text document)	org.openoffice.da.writer2xhtml5
HTML5 (spreadsheet)	org.openoffice.da.calc2xhtm15
EPUB	org.openoffice.da.writer2xhtml.epub
EPUB 3	org.openoffice.da.writer2xhtml.epub3

This table lists the special properties available for the filter data (all are optional):

Property	Purpose
ConfigURL	Sets the URL for the configuration to use
TargetTemplateURL	Sets the URL for an XHTML template to use (XHTML and EPUB only)
StyleSheetURL	Sets the URL for a CSS style sheet to include (EPUB only)
ResourceURL	Sets the URL for a folder containing resources (images and fonts) referred in the style sheet (EPUB only). All files contained in this folder will be included with the style sheet in the same directory as the style sheet. The media type will be determined from the file extension. If you want to define the media type yourself, use the more complex property Resources.
Resources	Sets a list of resources (images and fonts) referred in the style sheet (EPUB only). This property is a semicolon separated list. Each entry is of the form URL[[::file name]::mime type] where the parts in square brackets are optional. For example file://mycomputer/home/myself/images/bg.png::background.png::image/pr to point to a png image which is referenced by the file name background.png in the style sheet. The resource file will be placed in the same directory as the style sheet.

The URLs can contain variables such as \$(user) for the user installation of LO. Thus for example "\$(user)/myconfig.xml" can be used to point to a configuration within the user installation. See

http://api.libreoffice.org/docs/idl/ref/servicecom_1_1sun_1_1star_1_1util_1_1PathSubstitution.html

for a list of available variables.

As a special feature, you can require one of Writer2LaTeX's standard configurations. To do this, the URL should start with an asterisk, for example "*ultraclean.xml".

7.3 Batch conversion with UNO

Writer2LaTeX also offers a uno service

org.openoffice.da.writer2xhtml.BatchConverter

providing batch conversion of a complete directory into another format (usually XHTML) with index pages. This service implements the interface org.openoffice.da.writer2xhtml.XBatchConverter, which provides a single method

```
// method
// org::openoffice::da::writer2xhtml::XBatchConverter::convert
void convert ( [in] string sSourceURL,
   [in] string sTargetURL,
   [in] sequence<com::sun::star::beans::PropertyValue> lArguments,
   [in] XBatchHandler handler );
```

- The sSourceURL specifies the URL of the source directory
- The sTargetURL specifies the URL of the target directory
- The handler is an implementation of the call back interface org.openoffice.da.writer2xhtml.XBatchHandler, which is used to provide user interaction during the conversion process. See the IDL definition for documentation. If you use the batch conversion from a Basic macro, the interface must be implemented using CreateUnoListener.

The available arguments (for the parameter lArguments) are specified in this table

Argument	Description
Recurse	Set to true (default) if you want to convert subdirectories
Uplink	You can set this to an URL, which will be used as an uplink on the index
	page for the top level directory
DirectoryIcon	You can set this to an URL pointing to an image that represents a direc-
	tory
DocumentIcon	You can set this to an URL pointing to an image that represents a doc-
	ument
TemplateURL	You can set this to an URL pointing to an XHTML template that should
	be used to generate the index page(s).
	Note that if you want to provide an XHTML template for the documents
	as well, this must be done using the FilterData (and the templates may
	be different).
IndcludePdf	Set this to true (default) if you want to include a pdf version of each file
	in addition to the XHTML version
UseTitle	Set this to true (default) if you want to use the document title in the
	index page rather than the file name
UseDescription	Set this to true (default) if you want to include the description of the
	document in the index page.

	You can set this to the name of any Writer export filter you have available
WriterFilterName	in your LO installation. The default is the XHTML export filter provided
	by Writer2xhtml (org.openoffice.da.writer2xhtml).
	The structure of this argument depends on the filter, but for the default
WriterFilterData	filter it is a sequence of PropertyValues to pass options to the filter (see
	above).
	You can set this to the name of any Calc export filter you have available
CalcFilterName	in your LO installation. The default is the XHTML export filter provided
	by Writer2xhtml (org.openoffice.da.calc2xhtml).
	The structure of this argument depends on the filter, but for the default
CalcFilterData	filter it is a sequence of PropertyValues to pass options to the filter (see
	above).

7.4 Converting from StarMath with a Basic macro

In addition to converting a complete document, you can also convert a single formula from StarMath to LaTeX. To do this, the uno service

```
\verb|org.openoffice.da.writer2| a tex. \verb|W2LStarMathConverter||
```

is provided. This service supports two methods

```
string convertFormula ( [in] string sStarMathFormula );
string getPreamble ( );
```

- The method convertFormula converts a StarMath string to a LaTeX string
- The method getPreamble returns a LaTeX preamble suitable for processing the converted formulas.

This small example is a Basic macro that converts a few formulas and displays the result. Note that the last conversion triggers a definition of the LaTeX macro \defeq in getPreamble().

```
Dim smc As Object
smc = CreateUnoService( _
          "org.openoffice.da.writer2latex.W2LStarMathConverter")
MsgBox smc.convertFormula("1 over 2")
MsgBox smc.convertFormula("int from 1 to infty f(x)dx")
MsgBox smc.convertFormula("sqrt 3")
MsgBox smc.convertFormula("f(x) def x^2-1")
MsgBox smc.getPreamble()
```

8 TROUBLESHOOTING Page 46

8 Troubleshooting

Writer2LaTeX can convert quite large files. But if you have a very large document, you could get the following error message :

```
Exception in thread "main" java.lang.OutOfMemoryError: Java heap space
```

In that case, you need to manually increase the memory available to the java virtual machine, for example using the following command to convert your document:

```
java -Xmx512M -jar writer2latex.jar bigFile.sxw out.tex
```

In the example, the heap size is set to 512 Megabyte of RAM. If you still get the "heap space" error, try setting the available memory even higher (assuming that your computer has enough physical RAM).

If you are using Writer2LaTeX as an export filter in LO, this problem will result in a generic error message saying that that document could not be written. To increase the heap size in this case, choose **Tools – Options – LibreOffice – Advanced**. Click **Parameters**, and add the parameter -Xmx512M (or higher).
